The relationship between risk attitudes and academic achievement and self-confidence of high school students in Selçuk, Turkey. The study was conducted to investigate the relationship between risk attitudes and academic achievement and self-confidence of high school students in Selçuk, Turkey. This was a descriptive study in which 220 students from Selçuk were included. The subjects were classified into three age groups (high school students in the third, fourth and fifth years) according to their grades. The data obtained were evaluated using the SPSS 17.0 program. The data were analyzed with descriptive statistics. There was a statistically significant difference between the mean of academic achievement and the risk attitudes of the subjects (p Q: Google Calendar API how to get participants list for an event? I'm writing my first iOS app with Google Calendar API and I was wondering if it is possible to retrieve the list of participants for an event, i.e. the participants' emails. Currently, I'm able to retrieve event information, as well as the events details, but there is no information about the participants. If it is not possible with Google API, I'd appreciate a list of events with participants information (if it is available). Thanks A: It looks like you can find the list of participants in the Event.participants (Reference) property: "participants": [{ "emailAddress": "alice@gmail.com" }, { "emailAddress": "bob@

[Atherosclerotic lesions of the carotid artery in a 4-year-old girl with high serum level of beta 2-microglobulin]. We report a 4-year-old girl with atherosclerotic lesions of the carotid artery. The first symptom of the disease was a short period of aphasia. The patient had high serum level of beta 2-microglobulin (beta 2-MG). Carotid arteries were demonstrated in angiography and echotomography. Beta 2-MG was tested in all main organs, but high serum level was detected only in the serum. The levels in urine and feces were normal. Atherosclerosis could be suspected of the patient's family. Other cases of high serum level of beta 2-MG were described in the literature, but not as young as in this case. The pathogenesis of the high serum level of beta 2-MG in this case could not be explained in this report, although this disease seems to be an important risk factor in patients with atherosclerosis. Persistent subpopulations of human cancer cells with stem-cell-like properties are emerging as targets for cancer therapies, since they are capable of producing metastatic tumors. However, the precise cellular origins and the molecular mechanisms regulating self-renewal of cancer stem cells (CSC) remain poorly understood. We recently identified, through in vivo gene profiling of early breast cancer metastases, a candidate CSC marker (cell surface proteoglycan Syndecan 1) that is expressed by circulating breast cancer cells. The candidate marker and its high-level expression on the surface of a breast cancer cell population sorted by high expression of CD44 and CD24 (the standard breast cancer markers used for separation of mammary epithelial stem cells) indicates that Syndecan 1+ cancer cells are potential mammary epithelial stem cells. Our preliminary data further suggest that Syndecan 1+ breast cancer cells are tumorigenic and metastatic, and they express several stemness-related molecules and genes including CD44, ABCG2, SOX2, Nanog, and ALDH1A1, which
