What's New in the?

TFTP Server Tester is written in Python using the PIL library in order to read and write images to and from the remote server. Python is a scripting language that is easy to understand and use. It supports the development of interactive programs. It is not a full blown programming language such as C, C++, etc. For now TFTP server tester can support the following features: • Read images and write them to a given directory on the remote server • Write image to a given directory on the remote server • Display the image received from the remote server • User friendly command line interface • Easy to use from any directory • Uploaded images can be checked on a remote server for performance The application is distributed under the GNU Public Licence and may be used for free. However it can be used for commercial purposes if the user is allowed to add images. For the full set of features and instructions see the TFTP Server Tester WEB site. TFTP Server Tester Features TFTP server tester is an application that allows you to access a directory on a remote server through a web browser. It also allows the user to have a directory on the remote server that he can access and use the remote server's image processing abilities. TFTP Server Tester can be used from a local or remote directory. The application supports the use of wildcards in the file names. The user can specify the directory where the images are to be stored and also specify the directory where the images are to be retrieved. The images can be downloaded as JPG, PNG, GIF, BMP. The application supports FTP, SFTP and FTPS protocols. The application supports the "-r" option to check images for errors. The application supports the option to open the images with a specific viewer or to change the downloaded images to a specific bit depth. The application can also display the image. The application supports the option "-a" to set the specific host that the images are stored on. The application supports the "-d" option to change the current directory where the images are saved. The application supports the option to specify the name of the image that will be created on the remote server. The application supports the "-u" option to specify the user name that will be used to access the remote server, the "-p" to specify the password and the "-v" to specify the level of debug messages.

System Requirements For TFTP Server Tester:

Windows® 2000/XP/Vista/7 Mac® OS X (Intel or PowerPC) 256 MB RAM (minimum), 512 MB RAM (recommended) Intel Pentium 4 or AMD Athlon XP with minimum of 1 GB RAM CD-ROM drive with minimum of 16 MB available space Languages: English, French, Italian, German, Japanese, Korean, Chinese (Simplified and Traditional) More information...
