WankItNow.comQ: Request for a good language (or scripting language) to program against (with built-in systems of course) I'm looking for a language that is easy to do embedded development in but has a good "tree" (that is, there are a lot of good libraries to connect to databases, spreadsheets, etc) and also a scriptable language, to be able to program one's own apps for embedded devices. Any ideas? Any suggestions? Edit: I would be more than willing to use Visual Basic for Windows if such a language existed (it doesn't but that's what I'm currently using). Edit 2: We are using the Altair BeagleBoard in our homescreens and I would like to eventually develop for it but it doesn't seem like there is any kind of "next gen" board for the Beagleboard that I can use now (it's an ARM based processor and I believe all new boards are x86 based now). The Beagleboard was designed for kids to program it so it has a very simple and easy interface. A: People need to stop asking for C++. It isn't embedded ready. It isn't linux ready. It isn't microcontroller ready. It isn't UAV ready. Just not ready. You can do all of the embedded programming you need to do in C and make sure you know how the stack works and how things are laid out in memory and just about every other power of the English language, and you'll be fine. That said, If I were to suggest a language that would be embedded ready, even with a dearth of libraries and a relatively small community, it would be Python. It doesn't have the same level of performance as native compiled code, but it is really fast in comparison to other programming languages. A: The best way to do embedded programming in Python is not via the standard library. Embedded programs should be written in assembler and cross compiled to native code.
