What's New in the GreenForce-Player?

GreenForce-Player is a regular media player that comes with a twist - it also allows you to password-protect audio and video files. The interface of this program has simplistic elements, making it simple for the user to navigate through its features. Media files can be imported into GreenForce-Player via the file browser or "drag and drop" method. So, you can use basic functions, such as pause and stop, go to the next or previous track, set the volume and navigate freely within the clip. Additionally, you can switch to full screen mode, enable looping or shuffling mode, load subtitles, switch to minimal view (without the bars) and change the aspect ratio. But you can also load streaming media from URL, create, import and save playlists, access the most recently used files, play an audio CD or video DVD, view cover art, save the media position, enable visualization mode

(waveform, frequency or white light), as well as enable GreenForce-Player to stay on top of other processes. When you set a password to protect a file, you can also edit tags (title, album, interpreter and comment), add a cover file, input the codec name, disallow screenshots and enable an expiration date. Plus, you can delete stored passwords.

GreenForce-Player requires a moderate amount of system resources, includes a brief help file with snapshots, supports three log levels (none, error or debug), multiple instances and several languages for the interface, and can automatically check for updates online. We highly recommend GreenForce-Player to all users who prefer a straightforward software which manages to deliver excellent features. Screenshot(s):
